

Areca Plates Manufacturing

Areca palm tree drops its leaves naturally when the old leaves are making room for the new leaves. These leaves have been used as plates for dining purposes for centuries. With new technology this natural and rigid material can be compressed to a shape of a design plate which in use with dry food can last longer periods.

The production process of the plates doesn't require added chemicals or heavy infrastructure. The carbon footprint of making the plate consists mainly of heating water and the metal cast. Because the tree drops its leaves naturally the production process doesn't require cutting or harming of the trees.

Please get in touch with us to celebrate the eco friendly occasion with areca leaf plates and food containers.
